ACKNOWLEDGMENTS

The development of the science components of the Models-3 Community Multiscale Air Quality (CMAQ) system represents a major undertaking by a large team of dedicated atmospheric scientists and a relatively long term effort beginning in the early 1990s, and covers a wide area of subject material as embodied in each of the contributing chapters. Most of the EPA Models-3 CMAQ Science Team are from the Atmospheric Modeling Division (AMD) in the EPA Office of Research And Development's National Exposure Research Laboratory (NERL). With several exceptions the contributing authors from this Division are on detail from the Air Resources Laboratory of the National Oceanic and Atmospheric Administration (NOAA). The NOAA-AMD effort is supported through Interagency Agreement (DW13937252) with the EPA. The authors of each of the chapters of this document would like to collectively express their gratitude to the other members of the NOAA Division. In particular we acknowledge the encouragement and support of the Director of the Atmospheric Modeling Division, Francis Schiermeier. We are indebted to Dr. Robin Dennis for his vision and role in ensuring the implementation of holistic-one-atmosphere approach into CMAQ. We also recognize the technical help from our colleagues Tom Pierce, Steven Howard, Alfreida Torian, and Gary Walter.

We also want to recognize the contributions, helpful discussions, and assistance of many members of the science community, either through formal agreements or through peer interest. For example, the work was supported by several cooperative agreements including:

- Atmospheric Modeling Research-Scientific and Computational (CR-822066: MCNC), Principal Investigator (PI): Kenneth Galluppi Ed Bilicki, Steve Fine, Alison Eyth, and Rohit Mathur;
- Research on Computational Framework in Generic Grids, Adaptive Grids, and Subgrid Treatment of Air Quality Simulation (CR-822053: MCNC), PI: Talat Odman; with R.K. Srivastava and D.S. McRae, North Carolina State University);
- Transport Algorithms for Air Quality Simulation Models (CR-822059, MCNC), PI: Talat Odman;
- Emissions Modeling Research with High-Performance Computing (CR-822074: MCNC), PI: Carlie Coats;
- Advanced Modeling of Meteorology in Support of Air Quality Models (CR-822628: (MCNC), PI: Aijun Xiu, Kiran Alapaty, John N. McHenry, and Adel F. Hanna; with Nelson L. Seaman and Aijun Deng, Pennsylvania State University; and John S. Kain, National Severe Storms Laboratory);
- A Flexible and Efficient Methodology for Modeling Aerosol for Air Quality Models (CR-823634: MCNC), PI: Uma Shankar, Mark Read and Atanas Trayanov; with Anthony Wexler, University of Delaware; and John H. Seinfeld, California Institute of Technology;
- Develop Methods for Technology Transfer of Advanced Regional/Urban Air Quality Models (CR-822080: NCSU), PI: Alan Schula; and
- Plume-in-Grid development for a Multiscale Air Quality Modeling System (IAG DW64937190, Tennessee Valley Authority (TVA)), PI's: Robert E. Imhoff; with Noor Gillani, Arastoo Biazar (now at Monash University, Australia), and Yu-Ling Lu, University of Alabama, Huntsville).

The following scientists also contributed under the formal contracts listed: Ruen Tang, Chris Maxwell, and Hao Jin of the Technical Support Group, Dyntel Corp. (General Services Administration IAG DW47937823); Tod Plessel, and Yan Ching Zhang of the Visualization Laboratory, Lockheed Martin (EPA Contract 68-W7-0055); and Nick Moghari, Joe Susick, and Dave Tivel of Science Applications International Corporation (SAIC) (EPA Contract 68-W1-0055).

Significant contributions were made by: visiting scientists, including Sang-Mi Lee of the Seoul National University, Korea, Chong Bum Lee of the KangWeon University, Korea, and Seiji Sugata of the National Institute for Environmental Studies, Japan; UCAR's post doctoral fellows Yonghong Li, Qingyuan Song and Shoba Kondragunta; and Dr. Ingmar Akermann of Ford Research in Aachen, Germany.

It is also a pleasure to thank the colleagues who engaged us in many seminal technical discussions on various aspects of the CMAQ system. We recognize Professors Harvey Jeffries, University of North Carolina at Chapel Hill; Ted Russell, Georgia Institute of Technology; Nelson Seaman and Jack Kain, Pennsylvania State University; Dick McNider, University of Alabama, Sonia Kreidenweis, Colorado State University, Panos Georgeopolus of Rutgers University, and Itsushi Uno of Kyushu University, Japan. Many of our EPA colleagues provided stimulating discussion or reviews of our effort including Gail Tonnesen, Deborah Luecken, Carey Jang, John S. Irwin (NOAA) and Ed Edney.

We are indebted to the following peer reviewers, who gave unselfishly of their time and whose comments and suggestions were extremely valuable in improving the scientific aspects of the report. Listed in alphabetical order, the reviewers are followed by the chapter(s) they reviewed: Jeff Brook, Atmospheric Environment Service, Canada (Ch. 17); David Chock, Ford Research Laboratory (Ch. 2 and 7); Henry Hogo, Southern California Air Quality Modeling Division (Ch. 8 and 16); Sasha Madronich, National Center for Atmospheric Research (Ch. 14); Paulette Middleton, RAND Environmental Science & Policy Center (Ch. 10); Ted Russell, Georgia Institute of Technology (Ch. 18); Nelson Seaman, Pennsylvania State University (Ch. 3); Christian Seigneur, Atmospheric and Environmental Research, Inc. (Ch. 10 and 11); Trevor Sholtz, ORTECH Corporation (Ch. 4); Saffet Tanrikulu, California Environmental Protection Agency (Ch. 9 and 12); Robert Yarmartino, Earth Tech (Ch. 5 and 6); and Zion Wang (Ch. 13, 15, and 16).

Finally, the editors note with great appreciation, the efforts of Brian Eder, who facilitated many of the activities and tasks involved in the preparation and completion of this document. We thank the Raleigh, North Carolina, staff of SAIC, especially Alice Gilliland (now with NOAA-AMD) and Andrea Verykoukis for their critical contributions in the area of technical editing, assuring a high level of consistency and quality in all the chapters of this manuscript. We are also grateful to Alice Gilliland for her invaluable work on the Executive Summary.
